

Run android app on website

Continue

Video calls have become an integral part of our lives, especially during the pandemic. Video conferencing apps have added relevant features over time to give us a better experience. Google is also popular for its continuous updates and innovations. The American tech giant has announced its Duo calling service for Android TVs long back. Recently, Google has merged its two video calling apps, Google Meet and Google Duo. All the Google Meet features are available with Google Duo which has been combined into a single video calling solution. Moreover, Google has updated the original Meet app and made it available for Android users with a new green icon and a change in name to Meet (original). This app allows users to make and answer the one-to-one and group calls with the new Duo-Meet on an Android TV. The app supports Android TV's homescreen, so users can access it through the 'app drawer' on their TV or add it to the list of their favourites. The app would be available for installation on an Android TV via Google Play Store. Here is how to set up Google Duo on an Android TV:STEP1 Open Google Duo on an Android tv. STEP 2 Sign into your account. STEP3 Choose the grant access option. STEP 4 Follow the on-screen instructions to complete the set-up. Notably, to successfully set up Google Duo on an Android TV, users must have an Android TV with Android 8.0 Oreo or a higher version, a USB camera and microphone if a camera or a microphone is not built into an Android TV or Android TV device, and a stable internet connection. To successfully run the Google Duo on an Android TV, users must remember these points: The USB port on the camera must be plugged into the Android TV Box in case it is being used. Google Duo will not function if a user is using a Chromecast on a non-Android TV. Users can record audio using a USB microphone connected to their Android TV. The audio on Duo calls cannot be controlled by their Android TV remote. The Duo app must be open on an Android TV in order to receive calls. Catch all the Technology News and Updates on Live Mint. When building an Android app, it's important that you always test your app on a real device before releasing it to users. This page describes how to set up your development environment and Android device for testing and debugging over an Android Debug Bridge (ADB) connection. Note: Use the Android emulator to test your app on different versions of the Android platform and different screen sizes. Also consider using Firebase Test Lab to run your app on a wide variety of real devices hosted in a cloud-based infrastructure. Set up a device for development Before you can start debugging on your device, decide if you want to connect the device to using a USB cable or Wi-Fi. Then do the following: On the device, open the Settings app, select Developer options, and then enable USB debugging (if applicable). Note: If you do not see Developer options, follow the instructions to enable developer options. Set up your system to detect your device. Chrome OS: No additional configuration required. macOS: No additional configuration required. Ubuntu Linux: There are two things that need to be set up correctly: each user that wants to use adb needs to be in the plugdev group, and the system needs to have udev rules installed that cover the device. plugdev group: If you see an error message that says you're not in the plugdev group, you'll need to add yourself to the plugdev group: sudo usermod -aG plugdev \$LOGNAME Note that groups only get updated on login, so you'll need to log out for this change to take effect. When you log back in, you can use id to check that you're now in the plugdev group. udev rules: The android-sdk-platform-tools-common package contains a community-maintained default set of udev rules for Android devices. To install: apt-get install android-sdk-platform-tools-common Windows: Install a USB driver for ADB (if applicable). For an installation guide and links to OEM drivers, see the Install OEM USB drivers document. Connect to your device using USB When you are set up and plugged in over USB, you can click Run in Android Studio to build and run your app on the device. You can also use adb to issue commands, as follows: Verify that your device is connected by running the adb devices command from your android_sdk/platform-tools/ directory. If connected, you'll see the device listed. Issue any adb command with the -d flag to target your device. Connect to your device using Wi-Fi Android 11 (and later) supports deploying and debugging your app wirelessly from your workstation via Android Debug Bridge (adb). For example, you can deploy your debuggable app to multiple remote devices without physically connecting your device via USB and contending with common USB connection issues, such as driver installation. To use wireless debugging, you need to pair your device to your workstation using a pairing code. To begin, complete the following steps: Ensure that your workstation and device are connected to the same wireless network. Ensure that your device is running Android 11 or higher. For more informaton, see Check & update your Android version. Ensure that you have Android Studio Bumblebee Canary. You can download it here. On your workstation, update to the latest version of the SDK Platform-Tools. To connect to your device, follow these steps: Open Android Studio and select Pair Devices Using Wi-Fi from the run configurations dropdown menu. Figure 1. Run configurations dropdown menu. The Pair devices over Wi-Fi window pops up, as shown below. Figure 2. Popup window to pair devices using QR code or pairing code. Enable developer options on your device. Enable debugging over Wi-Fi on your device. Figure 3. Screenshot of the Wireless debugging setting on a Google Pixel phone. Tap on Wireless debugging and pair your device: To pair your device with a QR code, select Pair device with QR code and scan the QR code obtained from above. To pair your device with a pairing code, select Pair device with pairing code from the Pair devices over Wi-Fi window above. On your device, select Pair using pairing code and take note of the six digit pin code. Once your device appears on the Pair devices over Wi-Fi window, you can select Pair and enter the six digit pin code shown on your device. Figure 4. Example of six digit pin code entry. After you are paired, you can attempt to deploy your app to your device. To pair a different device or to forget this device on your workstation, navigate to Wireless debugging on your device, tap on your workstation name under Paired devices, and select Forget. Troubleshoot device connection If your device is not connecting to Android Studio, try the following to resolve the issue. Troubleshoot with the Connection Assistant The Connection Assistant provides step-by-step instructions to help you set up and use a device over the ADB connection. To start the assistant, choose Tools > Troubleshoot Device Connections. The Connection Assistant provides instructions, in-context controls, and a list of connected devices in a series of pages in the Assistant panel. Use the Next and Previous buttons at the bottom of the Assistant panel to work through the pages as needed: Connect your device over USB: The Connection Assistant begins by prompting you to connect your device over USB, and it provides a Rescan USB devices button with which you can start a new scan for connected devices. Enable USB debugging: The Connection Assistant then tells you how to enable USB debugging in the on-device developer options. Restart the ADB server: Finally, if you still don't see your device on the list of available devices, you can use the Restart ADB server button on the last page of the Connection Assistant. Restarting the ADB server also causes ADB to scan for devices again. If you still don't see your device on the list of available devices, try the troubleshooting steps in the next section of this page. Resolve USB connection issues If the Connection Assistant is not detecting your device over USB, you can try the following troubleshooting steps to resolve the issue: Check that Android Studio can connect to the Android Emulator To check if the issue is being caused by a connection problem between Android Studio and the Android Emulator, follow these steps: Check the USB cable To check if the issue is being caused by a faulty USB cable, follow the steps in this section. If you have another USB cable, connect the device using the secondary cable. Check if the Connection Assistant can now detect the device. If the device is not detected, try the primary cable again. If the device still isn't detected, assume that the problem is with the device and check if the device is set up for development. If you don't have another USB cable but you do have another Android device: Connect the secondary device to your computer. If the Connection Assistant can detect the secondary device, assume that the problem is with the primary device and check if the device is set up for development. If the secondary device is not detected, the problem might be with the USB cable. Check if the device is set up for development To check if the issue is being caused by settings on the device, follow these steps: Follow the steps in the Set up a device for development section. If this does not resolve the problem, contact the device OEM's customer support for help. Tell the customer support representative that the device won't connect to Android Studio using ADB. Resolve wireless connection issues If you are having issues connecting to your device wirelessly, you can try the following troubleshooting steps to resolve the issue. Check if your workstation and device meet the prerequisites To meet the prerequisites for wireless debugging, ensure that: Your workstation and device are connected to the same wireless network. Your device is running Android 11 or higher. For more information, see Check & update your Android version. You have Android Studio Bumblebee. You can download it here. You have the latest version of the SDK Platform Tools on your workstation. Check for other known issues The following is a list of current known issues with wireless debugging in Android Studio and how to resolve them. Wi-Fi is not connecting: Some Wi-Fi networks, such as corporate Wi-Fi networks, may block p2p connections and not allow you to connect over Wi-Fi. Try connecting with a cable or another Wi-Fi network. ADB over Wi-Fi sometimes turns off automatically: This can happen if the device either switches Wi-Fi networks or disconnects from the network. RSA security key When you connect a device running Android 4.2.2 (API level 17) or higher to your computer, the system shows a dialog asking whether to accept an RSA key that allows debugging through this computer. This security mechanism protects user devices because it ensures that USB debugging and other adb commands cannot be executed unless you're able to unlock the device and acknowledge the dialog.
